Cybersecurity, Privacy & Technology

Our Cybersecurity team counsel clients concerning data management, privacy, and data security-related legal services in a time of rapid and complex technological change. From e-mail transactions, data storage and business computing systems to cloud computing resources and social networking, companies rely on electronic data to conduct and drive their business operations. With a range of backgrounds in finance, insurance, health care, liability, intellectual property, and litigation, our Cybersecurity team provides advice that takes into account the standards and practices of the industries and legal frameworks in which our clients operate, as well as laws and regulations of the United States.

Bressler's interdisciplinary Cybersecurity team offers regulatory counseling, defends clients in enforcement actions, litigates privacy-related matters, and handles transactions where data protection and security issues arise. Clients also rely on Bressler's Cybersecurity, Privacy and Technology practice for counsel on eDiscovery issues including pre-litigation preparedness and the preservation, collection, review and the production of electronic information in litigation, as well as information governance issues related to data security, privacy, and records management. Our team advises clients across the spectrum of emerging data security and privacy laws, covering requirements in the health care, telecommunications, and the financial services industries.
